

Air Scouring of Potable Water Mains

Improve the water quality and service for your customers.

'us'- Utility Services is improving water quality through our air scouring service.

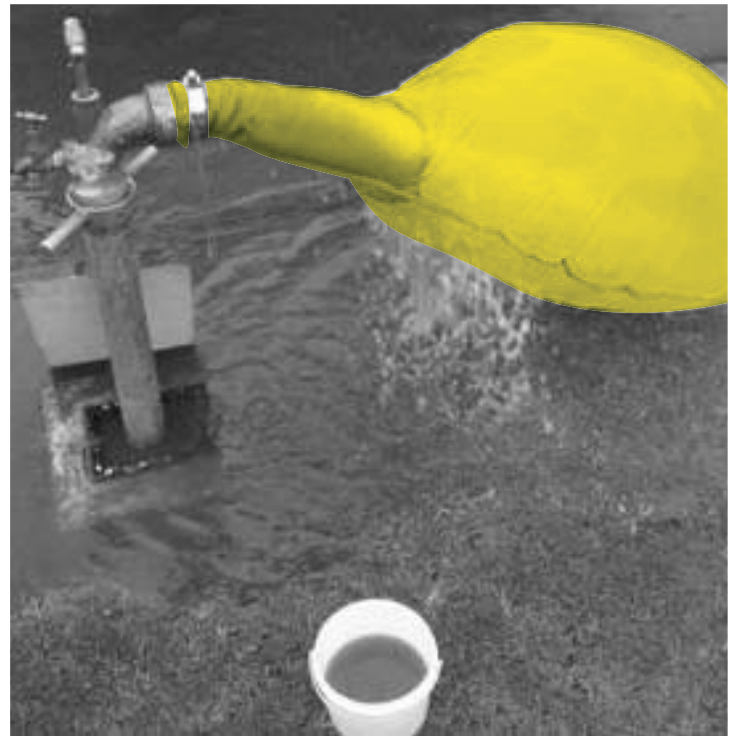

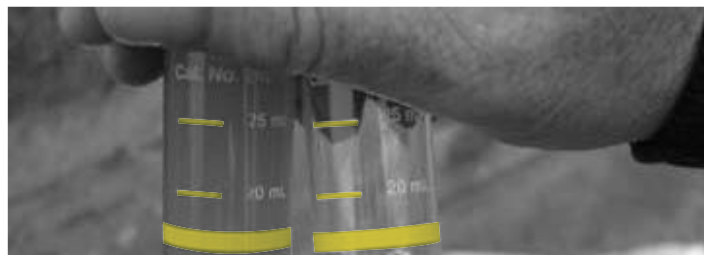

In our alliance agreement with South East Water, air scouring on a large portion of their water supply system takes place.

All works will be planned in conjunction with your representative to cater for environmental and customer issues, like school, hospital, shopping districts, commercial / industrial and private customers.

Additionally, a periodic report known as the Asset Fault Sheet will be created to address any asset issues observed, for future maintenance operations to engage proactively.

A Water sampling report will be provided, giving results on parameters, before and after the air scouring operations at various locations.

The disposal of water will be carried out in an environmentally sensitive manner using our filtration process to minimize for any solids to be expelled back into the storm water drain.

Features

- Joint consultative evaluation of planning documents for appropriate selection of jobs program to suit individual requirements.
- 'Work to commence' notifications distributed. Check of valves and ejection points.
- Connect temporary hoses and/or mini tankers. Collection of water samples, static pressure test on day of scouring.
- Commencement at notified time and as per works procedures
- Field water sample and return all valves and hydrants to their position. Repair any leaking hydrants
- Collate water sample sheets, shut down audit & asset fault sheets and present to authority
