

Technology saves water for Schools

South East Water has partnered with 'us' – Utility Services to bring a "smart meter" solution to its school customers.

HydroShare is an innovative web-based reporting system that enables South East Water's major customers to further their knowledge and understanding of their water consumption.

HydroShare's on-line, real-time monitoring and reporting system allows school management to save time, money and water.

HydroShare has the potential to not only reduce schools' water usage but to also act as a curriculum resource that will offer a high level of engagement with the students. It provides a terrific addition to the school curriculum, allowing students to understand and manage their water use, and presents an opportunity to show leadership in the school's community.

Case Study

SCHOOLS

A trial of the HydroShare technology at schools has already proved successful, with significant water savings being recorded. South East Water worked with a small school within its service area and through the use of the HydroShare technology, a constant leak was recorded. This leak could have wasted approximately 600KL of potable water for the year had it not been detected.
